

19. Write a program to demonstrate ForEach controller with Xpath extractor in JMeter.

The ForEach Controller and XPath Extractor can be used together to iterate over a set of XML elements and perform actions on each element.

To use the ForEach Controller with the XPath Extractor in JMeter, follow these steps:

Add a ForEach Controller to your JMeter Test Plan.

In the ForEach Controller's properties, set the following:

Input variable: The name of the variable that contains the XML data.

Output variable name: The name of the variable that will contain the extracted values.

XPath query: The XPath query that will be used to extract the values.

Add the XPath Extractor under the ForEach Controller node.

In the XPath Extractor's properties, set the following:

Reference name: The name of the variable that contains the XML data.

XPath query: The XPath query that will be used to extract the values.

Add the samplers that you want to execute for each extracted value under the ForEach Controller node.

Run the test.
