

23. Write a program to demonstrate HTML assertions in JMeter

The HTML Assertion in JMeter allows you to validate the HTML syntax of a sampler response. This can be useful for ensuring that your web pages are well-formed and compliant with HTML standards.

To use the HTML Assertion in JMeter, follow these steps:

Add an HTML Assertion to the sampler that you want to test.

Configure the HTML Assertion to specify the type of check that you want to perform. You can check for the following:

Correct HTML syntax

Specific HTML elements and attributes

The presence of specific text in the HTML response

Run the test.

If the HTML Assertion fails, JMeter will display an error message. You can then use this information to debug your web page and fix the problem.
