

14. Write a program to demonstrate throughput controller in JMeter.

The Throughput Controller in JMeter is a controller that allows you to control the throughput of your test. This means that you can specify the number of requests per second that you want to send.

To use the Throughput Controller, simply add it to your JMeter Test Plan and then set the desired throughput in the Throughput Controller's properties dialog box. You can also set a maximum throughput, which is the maximum number of requests per second that the controller will send.
