

16. Demonstrate how to perform API documentation.

To perform API documentation in Postman, you can follow these steps:

Create a collection for your documentation. This collection will contain the requests that you want to document.

Add requests to the collection. Make sure to include all of the relevant requests, such as requests for creating, reading, updating, and deleting resources.

Configure each request. For each request, add a description, parameters, and examples.

Generate the documentation. Once you have configured all of the requests in your collection, you can generate the documentation by clicking the Generate Documentation button.

Review and publish the documentation. Once the documentation has been generated, review it to make sure that it is accurate and complete. You can then publish the documentation by clicking the Publish button.
