

11. Demonstrate how environments are used in Postman.

Environments in Postman are used to store and manage sets of variables that can be used across different requests. This can be useful for testing and managing APIs in different environments, such as production, staging, and development.

To create an environment in Postman, follow these steps:

Click the Environments tab in the sidebar.

Click the + button to create a new environment.

Enter a name for your environment and click Create.

Click the Variables tab.

Click the Add button to create a new variable.

Enter a name and value for your variable.

Click Save.
