

6. Demonstrate how to parameterize requests.

To parameterize requests in Postman, you can use variables. Variables allow you to store values that can be reused in different requests. This can be useful for testing different values for the same parameter or for sending requests to different environments.

To create a variable in Postman, follow these steps:

Click the Variables button in the top right corner of the Postman window.

Click the Add button.

Enter a name for the variable and the value that you want to store.

Click the Save button.
